# **CHAPTER 1**

## **INTRODUCTION**

### **1.1 PROJECT OVERVIEW**

A properly designed, installed, operated, and maintained fire alarm system can reduce the losses associated with an unwanted fire in any building. These losses include property and, more importantly, human life. The primary motivation for fire alarm system requirements in building and fire codes is to provide early notification to building occupants so they can exit the building, and to notify the fire service so it can respond to the fire. In settings such as hospitals the fire alarm system provides notification to staff so they can respond to the fire emergency (as opposed to evacuating the building). This module will explain the basic features of fire alarm systems and the inspection of these systems. It should be noted that fire alarm systems also are called "protective signaling systems," especially in NFPA documents and in other codes and standards.

Under the rather broad heading of fire protection systems, this module will examine the main components of alerting, suppression, and containment features and systems. Consideration of these systems is a natural adjunct to a discussion of hazards and building construction features. The primary components we will examine are fire alarm systems, fire detection and notification systems, suppression agents and systems, water distribution systems, automatic sprinkler systems, standpipe and hose systems, and portable fire extinguishers. This module will cover a lot of basic material meant to provide the novice inspector a solid foundation on which to build.

### **1.2 PURPOSE**

The primary purpose of a fire management system is to design, manage, plan and co-ordinate appropriate fire safety procedures to reduce the risks of fire and to ensure the safety of building occupants.

A complete fire management system ensures legal compliance and protection of lives and assets. Fire alarm systems are only effective if they can generate reliable and fast fire alerts with exact location of fire. There is a direct correlation between the amount of damage caused by fire and interventions time in various fire alarm systems. As the time of intervention decreases, the damage also decreases. Hence the

most important factor in a fire alarm system is the reaction or response time of fire alarm system, that is, the time between fire detection and extinguishing.

The earliest recorded examples of fire protection can be traced back to the Roman Empire and the catastrophic fires that started in Rome. As a result, Emperor Neron has adopted regulations that required fireproof material for walls and buildings restoration to be used. The second recorded case of adopting fire protection regulations occurred in the year 1666, after the Great fire of London, which destroyed more than 80% of the city. The fire of London spurred interest in the development of the first equipment for fire suppression in the form of hand pumps and fire hydrant installation for water supply.

#### 2.2 PROBLEM STATEMENT DEFINITION

**PAPER 1:**

**Sensor Based Smart Fire Detection and Fire Alarm System**

Published year: November 3, 2020

**Author name:**

**Rishika Yadav**

*Graphic Era Hill University, Dehradun, India*

**Poonam Rani**

*Graphic Era Hill University, Dehradun, India*

**Abstract**

The use of different IoT devices for home automation has become very popular in recent years. Fire detection and avoidance of fire accidents is one of the necessary and important application of home automation using IoT. Traditional fire alarm system requires huge installation cost and labour. The proposed IOT based fire alarm system basically detects fire at an early stage, generates an automatic

alarm and notify the remote user or fire control station about the fire outbreak. This also tries to +extinguish the fire. The use of Arduino is proposed to sense the surroundings for occurrence of fire with the help of fire and gas sensor. The development of home fire alert system is built based on Arduino board. The fire is detected at an early stage and the system generates an alarm and sends SMS or call alerts to mobile numbers stored inside the Arduino program, via the GSM module. Simultaneously, a water sprayer producing device is switched on for the control of fire. This prototype system can help users to improve their safety standards with immediate response by preventing accidents. This will eventually allow both the lives and the properties from the disaster. The functions of each module and its implementation is described in detail.

## **PAPER 2:**

### **Smart Fire Alarm System Using IOT**

**Published year:** July 13,2020

**Author name :**

Ibrahim Majid Al Shereiqi

Middle East College, Muscat, Oman

Muham mad Sohail

Middle East College, Muscat, Oman

## **ABSTRACT:**

The research paper proposes the “Smart Fire Alarm System Using IOT” in smart building by integrating IOT devices, including fire alarm devices (smoke and temperature detectors), Arduino and other complementary equipment. The idea of the research paper is when a fire occurs, the sensors will send a message to the security of the building and the official, and this message includes location and time. The internet of things is predicted to provide businesses and people with better visibility and has the power to control 99% of environments and available objects that are at this time out of reach of the internet. So therefor, IOT make opportunity to people and businesses to be attached with the outside world even more than before that will achieve more meaningful work in higher levels. The traditional fire alarm system contains several types of devices each has a specific role in system operation to detect people and warn them through visual and audible devices if there is a fire, smoke, carbon monoxide or any other emergencies. This type of alarm can automatically have activated from heat and smoke

detector and it could be activated by manual fire alarms such as manual focal point or intake station. Alarms can come as a motorized bell; horns or wall-mounted speaker they can also be luminous sound for speakers that actually sound an alarm, and add an audio evacuation message that for example will warn people against using elevator.

**PAPER 3: Design and Fabrication of an Automatic Sprinkler Fire Fighting System** Publication year: 2015

**Author name:**

Abdalsalam Ahmed, Abdulsalam Mansor, and Abdulgani Albagul

*Faculty of Electronic Technology Baniwald, Tripoli Road, Baniwalid, Libya*

**Abstract:**

This paper attempts to integrate microcontrollers into smoke detector circuitry and other components for safety purpose. This can be achieved by placing some sensors and devices in the building. In the proposed system, a smoke detector upon senses smoke activates its alarm, sends a low voltage signal to microcontrollers. The microcontroller will activate the relays which are connected to other components to alert residents that one of the smoke detectors has sensed smoke by means of voice and flashing lights. At the same time, it will send signals to valves, air suckers and the water pump. The solenoid valve will operate the water pump which delivers water to the room through pipes installed inside the building to attack the fire. Meanwhile, the air sucker will suck the smoke from the room to prevent suffocation. The proposed design is aiming to have cost efficient system, compact design, easily expandable, simple to install and replaceable components.

**Paper 4:**

**CloudFAS: Cloud-based building fire alarm system using Building Information Modelling**

**Published year:** 2020

**Authorname:**

Xiaoping Zhou , HaoranLi , JiaWang , JichaoZhao , QingshengXie , LeiLi , Jiayin Liu , Jun Yu

**Abstract:**

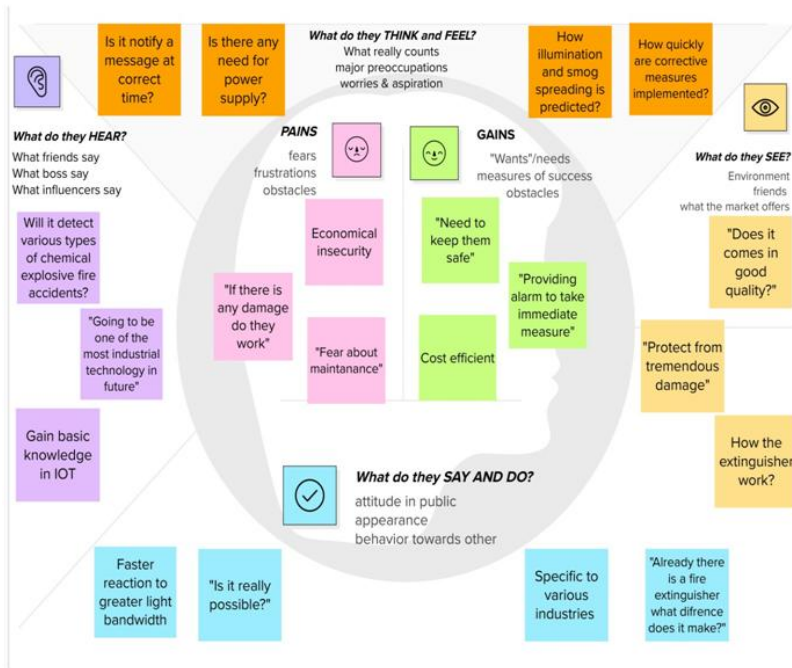

Building fires are a common urban disaster. The emergence of high-rise, large-scale and inner-complex buildings bring new challenges for fire safety and triggers new demand to upgrade traditional building fire alarm system (FAS). Different from current studies by deploying enormous smart fire sensors to replace FAS, this study addresses this issue from a novel perspective and proposes a cloud-based FAS using Building Information Modelling (BIM) on top of FAS, termed CloudFAS. Firstly, the

system framework and the software architecture are designed. Secondly, two key technologies are presented to address two unresolved technical issues: private fire alarm data sharing and alignment of fire sensors with the BIM model. A cloud gateway for fire sensors is developed to address the first problem by capturing the fire alarm data from the fire alarm control unit through the IEEE 1824 standard. Noticing that the fire sensor locations are listed in a sensor installation spreadsheet using natural language, termed as sensor location table (SLT). A natural language processing (NLP)-based sensor-BIM alignment algorithm is proposed to automatically match fire sensors with the BIM model through SLT, which enables to display fire sensor statuses in proper places in the 3D BIM model. Finally, a concrete case study from the China Construction Library is presented, which verifies the effectiveness of our proposed CloudFAS. Our CloudFAS is built on top of traditional FAS. If the fire alarm control unit follows the IEEE 1824 standard and an SLT is available, then CloudFAS can upgrade the traditional FAS in existing buildings effortlessly with its BIM model. Moreover, the cloud gateway for fire sensors contributes to addressing the private data sharing problem using IEEE 1824 standard, and the NLP-based sensor-BIM alignment algorithm can promote the adoption of BMI in the building operation phase.

## 3. IDEATION & PROPOSED SOLUTION

### 3.1 EMPATHY MAP CANVAS

### 3.2 IDEATION & BRAINSTORMING

## Brainstorm & idea prioritization

Use this template in your own brainstorming sessions so your team can unleash their imagination and start shaping concepts even if you're not sitting in the same room.

10 minutes to prepare  
 2-3 hours to collaborate  
 3-5 people recommended

[Share template feedback](#)

### Before you collaborate

A little bit of preparation goes a long way with this session. Here's what you need to do to get going.

10 minutes

- Team gathering**  
Gather who should participate in the session and send an invite. Share relevant information or pre-work ahead.
- Set the goal**  
Think about the problem you'll be focusing on solving in this brainstorming session.
- Learn how to use the facilitation tools**  
Use the Facilitation Questions to run a happy and productive session.

[Open article](#)

### Define your problem statement

What problem are you trying to solve? Frame your problem as a how might we statement. This will be the focus of your brainstorm.

5 minutes

**Problem**

No social or personal bias. The accidents in industries are being investigated by the project.

**Key rules of brainstorming**

To run a smooth and productive session

- Stay on topic
- Defers judgment
- Go for volume
- Encourage wild ideas
- Listen to others
- If possible, be visual

**Worked example**

How might we...  
 1. Reduce the number of accidents in industries?  
 2. Increase the safety of the workers in industries?  
 3. Improve the communication between the workers and the management?

[Start session](#)

2

## Brainstorm

Write down any ideas that come to mind that address your problem statement.

10 minutes

GOWRI SHANGARI E

Flame detector will detect the presence of a flame or fire.

It should not sprinkle water unless there is fire.

The temperature should be recorded continuously

If any flame detected the sprinklers will be switched on automatically.

The communication between the user and IOT need to be simple

SINDHUJA B

Gas sensor will detect the presence of a gas incase of any gas leakage

Based on the temperature readings, if any gas detected the exhaust fan gets power ON.

The system must provide accurate data

It will note it in the cloud for future needs

False data recording may cause error in future analysis.

VIJAYALAKSHMI K

Temperature sensor will detect the atmosphere temperature.

Alert message can be send through SMS.

Based on the python script logics the exhaust fan gets powered ON.

It will alarm incase if there is fire.

AHALYA PREETHI R

24\*7 water service should be maintained for sprinkler

focus the water on fire inorder to avoid wastage of water

making this system user-friendly is more important.

The access should be easy.

SNEGA ROOPA M

Alert should be sent to fire station as soon as possible.

configuration of IOT device and cloud is important

The location of place in danger due to fire will be shared along with the alert to the fire station.

The IOT components should accomodate the step by step process without any kind of delay.

3

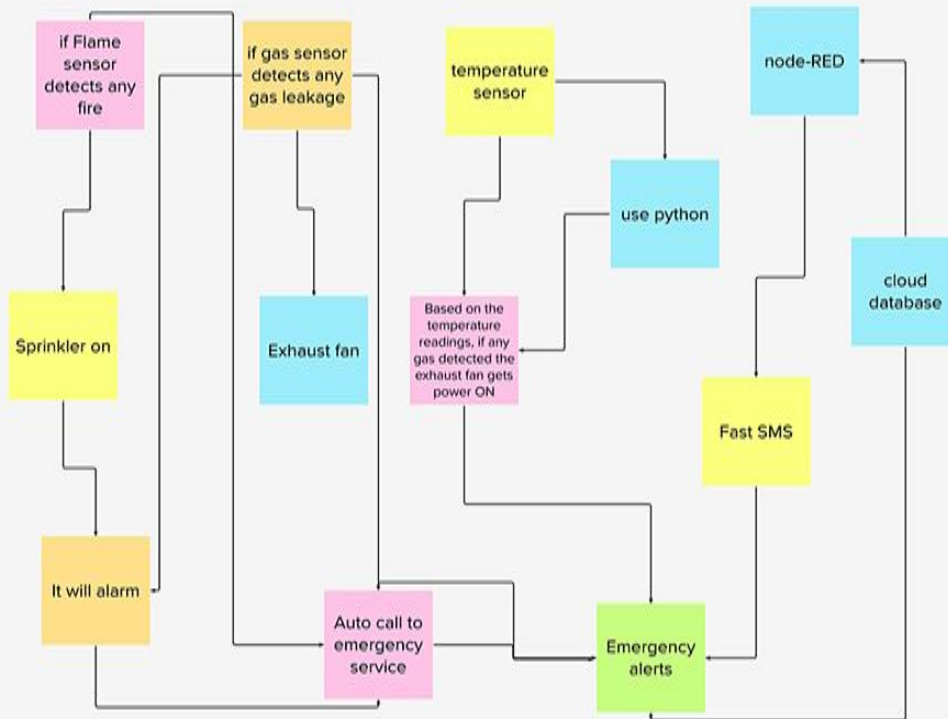

### Group ideas

Take turns sharing your ideas while clustering similar or related notes as you go. Once all sticky notes have been grouped, give each cluster a sentence-like label. If a cluster is bigger than six sticky notes, try and see if you can break it up into smaller sub-groups.

🕒 20 minutes

**TIP**  
Add customizable tags to sticky notes to make it easier to find, browse, organize, and categorize important ideas as themes within your mural.

### 3.3 PROPOSED SOLUTION

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	To improve the fire safety management system in industries.
2.	Idea / Solution description	Sense the temperature, flame & gas in the room periodically. If it exceeds the threshold ring alarm and sprinkle water and notify the user.

3.	Novelty / Uniqueness	An integrated system of temperature monitoring, gas monitoring, fire detection and automatic sprinklers to obtain the accurate information about locations and response through SMS notification and call.
4.	Social Impact / Customer Satisfaction	User friendly and low cost. Early detection of fire will help the industries and workers to evacuate before the fire takes over the buildings.
5.	Business Model (Revenue Model)	The product can be made compact, cost efficient and easily installable so that all the small scale to large scale industries can afford to buy the product which creates profit and increases the sale.
6.	Scalability of the Solution	This is complete system makes it easily expandable and business efficient for the fire detection, with the significant cost.

### 3.4 PROBLEM SOLUTION FIT

<b>1. CUSTOMER SEGMENT(S)</b> <span>CS</span> According to our problem statement, machine in industry and surroundings	<b>6. CUSTOMER LIMITATIONS</b> <span>CL</span> Devoid of access for fire detection Lack of performance leads to inconsistency of active and passive protection systems	<b>5. AVAILABLE SOLUTIONS</b> <span>AS</span> Immediate dialing of Fire service and fire extinguisher are the available solution when the face the problem in the past.
<b>2. PROBLEMS / PAINS</b> <span>PR</span> Poor Consistencies To detect the harmful / inflammable gas. To notify the customers as soon as possible in case of any fire accident. Alarming System for workers in case of any fire.	<b>9. PROBLEM ROOT / CAUSE</b> <span>RC</span> This fire alert system worked exactly like it was supposed to work. A fire alarm was activated and a guard was sent to check it out.	<b>7. BEHAVIOR</b> <span>BE</span> Proper maintenance of Industrial Infrastructure. Automation of Fire Control.
<b>3. TRIGGERS TO ACT</b> <span>TR</span> We can ask our customer to get an experience about our product. We can insist they must need of our product.  <b>4. EMOTIONS</b> <small>BEFORE / AFTER</small> <span>EM</span> Before: Customer is not find a proper rid for the fire spread problem. After: Now with the help of our product the customer can easily enhance problem.	<b>10. YOUR SOLUTION</b> <span>SL</span> An IOT based industry – specific, fire management system that focuses on early detection and management of false alarms and errors. Implementation of wireless technologies in transferring messages.	<b>8. CHANNELS of BEHAVIOR</b> <span>CH</span> ONLINE Call Emergency Number  OFFLINE Remove the Fire burn things

### 4. REQUIREMENT ANALYSIS

#### 4.1 FUNCTIONAL REQUIREMENTS

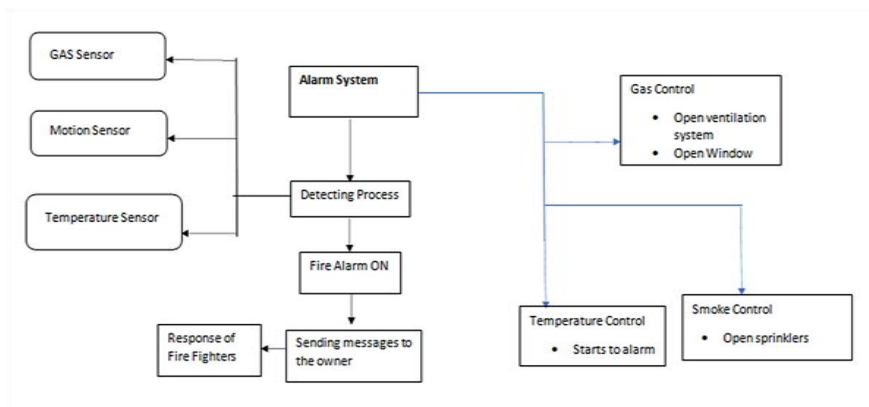

FR	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Registration	Registration through Form Registration through Mobile Number
FR-2	User Confirmation	Confirmation via Message Confirmation via Call
FR-3	User Login	Login through site or app using respective username and password
FR-4	User Upload	Client ought to be able to upload the information
FR-5	Fire Detection Monitoring	The sensors located will monitor the industry 24/7 and keeps updating the end user.
FR-6	Location Notification	Location of fire will be sent to the fire department through alarm or message

## 4.2 NON-FUNCTIONAL REQUIREMENTS

FR No.	Non-Functional Requirement	Description
NFR-1	<b>Usability</b>	It is simple and economic Easy to use
NFR-2	<b>Security</b>	Software remains secured in the face of attacks
NFR-3	<b>Reliability</b>	Response timer will be faster High Reliability The application runs accurately
NFR-4	<b>Performance</b>	If Fire detected it will be immediately notified the web application, and it also maintain track periodically.
NFR-5	<b>Availability</b>	Availability of the systems for institutions , restaurants and other public places.
NFR-6	<b>Scalability</b>	It accommodates easy modification for various requirements

```

## **10. ADVANTAGES & DISADVANTAGES**

### **ADVANTAGES:**

1. Sprinkler systems are automatic and respond at all times. Fire control is therefore rapid and no human intervention is needed.
2. Sprinkler systems are fitted with water flow 'gong' alarms and will alert occupants /guards of a developing fire. Significantly less heat and smoke is generated if the fire is extinguished at inception – this is what sprinklers are designed to do. Property damage is reduced.
3. A well-designed system will control a fire and fire/water damage will generally be localised. Occupants and fire fighters are exposed to much less danger if the fire is kept in check by a sprinkler system.
4. Savings on insurance premiums because sprinkler controlled fires are in the overall majority of instances less damaging than fires that are not kept in check by sprinklers.
5. Sprinkler controlled fires reduces the demand for security as it minimises intrusion opportunities. Sprinkler systems use significantly less fire water than hydrants, hydraulic hose reels or the fire brigade.

### **DISADVANTAGES:**

1. The one thing most fire alarm system inspectors caution against with wireless systems is having to replace the battery. The system is essentially useless if the batteries aren't charged, since it won't work properly. There is a bit of a burden to homeowners or business owners to always remember to keep the batteries fresh so the system operates properly when you need it most.
2. A couple other disadvantages fire alarm system inspectors point out is wireless systems have limited range and don't have centralized monitoring. Range can be a problem for large offices or homes, since a weak wireless connection may cause the system to not operate reliably. Wireless fire alarm systems also don't connect directly to the telephone lines, which are linked to the fire departments, so the response to an emergency could be slower as a result.

## **11. CONCLUSION**

There is a general agreement over the fire and protection segments that at 220,000 for every annum the degrees of bogus and undesirable alarms radiating from fire alarm and discovery frameworks is excessively high. Bogus and undesirable alarms squander fire and salvage administration assets; cause superfluous and costly interruption to end-clients which can bring about the loss of trust in frameworks and has seen a few frameworks turned off. As fire alarm and identifications frameworks are so firmly inserted into the clearing systems and strategies created to meet the necessities of Building Regulations and Fire Safety Law their utilization is far reaching and there are entrenched outsider accreditation plans for producers and installers. The item measures and testing systems anyway stay quiet on the reasons for bogus alarms.

## **12. FUTURE SCOPE**

The scope of the fire safety systems market includes the type of safety system with fire detectors and suppressors, such as gas, foam, and detectors. The increasing focus of the government bodies on

implementing fire safety equipment across various industries, such as chemical and petrochemical, oil and gas, pharmaceutical, aerospace, and defense, has led to the growth of the market studied.

### 13.APPENDIX

#### Source Code :

```
#include "DHTesp.h"
#include <cstdlib>
#include<time.h>

const int DHT_PIN = 15;
